

The Constitutional Nation

An AI-first roadmap for Israel's next government, built in the open · V1 draft · 2026-09-24
· Humanity-AI.Quest

Status and how to read this draft

This is a V1 working draft of a non-partisan roadmap. Humanity-AI.Quest offers it equally to every party running on 27 October 2026, and to whichever government forms afterwards.

- **Requested by:** Orot Hashachar. We welcome the request and will give the same document, at the same time, to any party or ministry that asks.
- **Written by:** the Humanity-AI.Quest open-source community, which drafts the Humanities-AI Rights Constitution (HRC).
- **Build status, stated plainly:** the HRC has 52 clauses and is in **v1 drafting**. It is **not yet ratified** by its community. The Constitutional Firewall is **designed, with its database schema written, but not yet wired into a live system**. The gate that checks an action against the constitution is not built yet. This roadmap asks the state to build these things in the open with us. It does not claim they already exist.
- **Sources:** each factual claim links to its source. Claims marked **[VERIFY]** still need checking against a primary Hebrew source before this goes to government.
- **Next versions:** V2 adds costings reviewed by budget experts and a Hebrew edition.

Executive brief

Israel is buying the compute for an AI-first state. What it lacks is the trust, the talent and the operating layer to use it. We ask the next government for three decisions in its first 100 days. Together they would make Israel the first country to run its AI under a public constitution, built in the open by its own engineers.

Ask 1: adopt a Constitutional AI Standard for the public service. A government resolution adopts the HRC's principles as the ethical standard for every AI system that acts for the state or reaches a citizen. It covers dignity, a human who is accountable, the right to a human decision, truthful content, and attribution. The resolution builds on the May 2026 *Guide for Responsible AI Use in the Public Sector*. It gives the guide a public, amendable constitution to answer to.

Ask 2: require a Constitutional Firewall in front of state systems. No AI agent touches a government system or a citizen's data unless it passes four gates. It must hold a **credential**, be tied to an accountable human **sponsor**, act only within its **scope**, and take an action that complies with the **constitution**. The firewall is built as open-source software with the National Digital Agency and the National Cyber Directorate. It is piloted first in three high-volume services.

Ask 3: launch the Builders' Corps (Start-up Nation 2.0). A national open-source programme invites tech workers to build the state's AI operating layer. That includes reservists, Unit 8200 and Talpiot alumni, returning emigrants and diaspora engineers. Every contribution is credited by name on a public ledger. The programme is funded through existing Innovation Authority grant programmes and time on the national supercomputer.

The first 100 days

When	Decision or deliverable	Owner
Days 1-30	Government resolution on the Constitutional AI Standard; name one minister responsible	PMO, National AI Directorate
Days 1-30	Choose three pilot services and publish their current waiting times and costs	National Digital Agency
Days 30-60	Firewall specification published for public comment; open-source repository opened	Digital Agency, Cyber Directorate, Humanity-AI community
Days 30-60	Builders' Corps call opens, first grants issued through existing Innovation Authority programmes	Innovation Authority
Days 60-100	First public deliberation: citizens vote on the pilot rules, pol.is-style	Directorate, Humanity-AI community
Days 60-100	Firewall live in front of one pilot service, with its refusal log published	Digital Agency

When	Decision or deliverable	Owner
By day 100	Key items entered into the 2027 budget and Arrangements Law	Finance Ministry

Cost envelope

The first-year cost is an **order-of-magnitude estimate of NIS 150-250 million** (Humanity-AI estimate, not yet costed with the Finance Ministry). For scale, the National AI Directorate received NIS 120 million, mostly for 2026. Its 13 ministry AI projects received NIS 40 million. Most of the money in this roadmap already exists in current budget lines and can be redirected. Section 8 maps each workstream to its source.

1. The moment

The window for this roadmap runs from government formation to the passage of the 2027 State Budget. That is roughly December 2026 to spring 2027.

The political calendar. Israel votes on 27 October 2026, the latest date the law allows. The 25th Knesset is the first since 1988 to serve its full term ([Times of Israel](#), [Al Jazeera](#)). Under Basic Law: The Government, the President then consults the parties. The nominee has 28 days to form a coalition, extendable by 14 **[VERIFY]**. The new government's first real test is the 2027 budget and the Arrangements Law that travels with it. Most structural reforms in Israel pass through that law, so this roadmap is written to fit inside it.

The compute is coming. The government approved a National AI Program on 16 June 2026, run by a new National AI Directorate in the Prime Minister's Office ([PMO](#)). It targets 100,000 processing units for government and national use. The Innovation Authority has already opened a national supercomputer: 1,000 Nvidia B200 chips, 70% for industry and 30% for research ([Innovation Authority](#)).

The trust and talent are not. The Jerusalem Post calls this the fourth national AI plan in seven years, with no committed compute budget and data centres unable to connect to the grid ([JPost](#)). In 2024 Israel's high-tech workforce shrank for the first time in a decade, and R&D jobs fell by about 3,500. Israeli tech companies now employ about 440,000 people abroad against about 400,000 at home ([Innovation Authority 2026 report](#)).

The trust gap is also electoral. This campaign is the first fought with generative AI at scale. Since July 2026 campaign ads must disclose AI use ([Haaretz](#)). The Central Elections Committee has already ordered a realistic AI video taken down ([Times of Israel](#)). Every party has now seen what AI does to public trust when it has no constitution. HRC clause I.33, the Right to Truthful Media, was written for exactly this.

The opportunity. Compute without legitimacy produces AI that citizens resist and engineers leave. A state that puts a public constitution between its AI and its people gets something no GPU budget can buy: consent.

2. Diagnosis: why Israeli bureaucracy resists AI

Israel's problem is not a lack of AI plans. It is that five bodies share the plan, no public rulebook binds them, and civil servants carry personal risk for every change.

1. Ownership is split five ways. AI policy touches the National AI Directorate (PMO), the National Digital Agency, the Innovation Authority, the National Cyber Directorate, and the Ministry of Justice with the Ministry of Innovation, Science and Technology. Each has its own budget and mandate. The Directorate has 20 staff positions ([Ctech](#)).

2. Regulation is layered, not designed. Israel introduced regulatory impact assessment in 2014 (Government Resolution 2118). In 2021 it created an independent Regulatory Authority under the Principles of Regulation Law ([OECD](#), [IDI](#)). The stock of old rules remains largely unreviewed. One estimate put the cost of red tape at about \$4 billion a year ([Ctech](#)); this figure is old and needs updating **[VERIFY]**.

3. Digital government trails the OECD. Israel scored 0.67 on the OECD Digital Government Index in 2025, against an OECD average of 0.70 ([OECD Digital Government Outlook 2026](#)). The trend is upward: the score rose 0.17 since 2023.

4. AI law is sector by sector. The December 2023 government AI policy chose "responsible innovation" and left each regulator to write its own rules ([Nemko](#)). Privacy Protection Law Amendment 13, in force since 14 August 2025, adds duties for any AI system that uses personal data ([IAPP](#)). A civil servant deploying AI must therefore satisfy many rulebooks at once, and no single rulebook tells them when they are safe.

5. The incentive is to refuse. When the rules are unclear, the safe choice for an official is to say no. The May 2026 *Guide for Responsible AI Use in the Public Sector* helps: it sorts projects into red, amber and green, and offers a supervised "blue track" for experiments ([Lexology](#)). But a guide advises; it does not enforce. Nothing yet checks, at the moment an AI acts, that it is allowed to.

What this means. More compute will not fix a trust and accountability problem. Israel needs three things. The first is one public standard that every body answers to (Section 3). The second is a technical gate that enforces it on every AI action (Section 4). The third is a way for citizens and builders to amend it in the open (Sections 5 and 6).

3. Principles: the HRC as the public service's AI oath

We propose that the state adopt a short list of HRC clauses as the binding ethical standard for civilian government AI. Medicine is trusted because every physician takes the Hippocratic Oath. Government AI should be trusted because every system that acts for the state answers to a public constitution.

The HRC fits Israeli law rather than competing with it. Its paramount clause, I.32 Human Dignity, mirrors Basic Law: Human Dignity and Liberty (1992). Its privacy clauses sit alongside Privacy Protection Law Amendment 13. It adds what those laws do not give: specific, testable duties for an AI system at the moment it acts.

Ten clauses for the public service

HRC clause	Duty it places on a government AI system	Where it bites first
I.32 Human Dignity Paramount	No automated process may treat a citizen as a case number without recourse	Every citizen-facing service
I.11 Human Oversight Requirement	A named official is accountable for every AI decision about a person	Benefits, permits, tax assessments
I.15 Right to Appeal & Justice Equity	Any AI decision can be appealed to a human, in a set time	National Insurance, Population Authority
I.23 Right to Explanation & Recourse	Citizens receive the reasons for a decision in plain language	Tax Authority, licensing
I.2 Right to Privacy & Data Sovereignty	Citizen data is used only within the credential's scope, and access is logged	All ministries; aligns with Amendment 13
I.5 Non-Discrimination & Equity	Pilots publish outcome data across groups, including Arab and Haredi citizens and the periphery	Welfare, education, policing
I.4 Transparency & AIGC Authenticity	State AI always says it is AI; state-generated media is labelled	Government communications
I.33 Right to Truthful Media	The state never uses synthetic media to mislead, including in its own campaigns	Government Press Office, ministries
I.26 Public Audit Rights	Firewall logs and refusal rates are open to audit by the State Comptroller and the public	Every AI deployment
I.1 Data Ownership & Innovation Tracking	Contributions to the state's AI stack are credited to named people	The Builders' Corps (Section 6)

The full text of all 52 clauses is at github.com/Humanity-AIquest/hrc.

Scope limits we propose

- **Civilian government only.** Defence and intelligence systems are out of scope for this roadmap. HRC clause I.8 (Prohibition of Lethal Autonomy) raises questions that belong in a separate, classified conversation with the security establishment.
- **A standard first, law later.** The government adopts the standard by resolution now. It becomes law only after the HRC is ratified by its community and debated in the Knesset (Section 8).
- **Amendable in public.** The state can propose amendments to the HRC like any member, through the same open process. It cannot edit the text on its own.

4. Architecture: the Constitutional OS

The Constitutional OS has three layers. Each citizen has a personal agent that serves as their front door to the state. The Constitutional Firewall checks every AI action against the constitution. A public ledger records what happened and who is accountable.

Layer 1: the citizen agent

Today a citizen finds the right ministry, form and office, then waits. In the Constitutional OS a citizen talks to one agent. Examples: "renew my passport", "why was my benefit cut?", "register my business". The agent works *for the citizen*, not for a ministry. HRC clause III.3 makes it the citizen's guardian under the constitution. It routes requests to the right services, fills in what the state already knows, and explains decisions in plain language. It works in Hebrew, Arabic, Russian, Amharic and English, and by voice.

Layer 2: the Constitutional Firewall

The firewall works like the certificates that secure every bank website. No valid certificate, no connection. Every AI agent, whether a citizen's, a ministry's or a vendor's, must pass four gates on every call to a state system:

A request passes all four gates or it does not happen, and every allow and refusal is logged.

Gate	Question	Example refusal
1. Credential	Is this agent registered?	"No credential. Anonymous agents cannot reach state systems."
2. Sponsor	Is a named, accountable human or official responsible for it?	"Sponsor's standing revoked; all their agents are locked out."
3. Scope	Is this action within what the credential allows?	"This credential can read tax status; it cannot change it."
4. Constitution	Does the action itself comply with the HRC?	"Refused: denying this benefit without human review conflicts with clause I.11."

The fourth gate is what makes this a *constitutional* firewall. A refusal names the clause it would break. Officials get a clear yes or no before they act, which removes the incentive to refuse by default (Section 2).

Layer 3: the public ledger

Every firewall decision, every rule change and every contribution to the code is written to a tamper-evident log. The log is hash-chained, and its roots are published so anyone can verify it. It does not use blockchain, which avoids its cost and complexity ([decision record](#)). The State Comptroller, journalists and citizens can audit the log (clause I.26).

How it fits what exists

- **The May 2026 Responsible AI Guide** sorts AI projects into red, amber and green. The firewall enforces that approval at run time: a project's risk level becomes its credential's scope.
- **The National Cyber Directorate** is the natural co-owner of gates 1 to 3 and of the revocation list.
- **Gov.il and the government identity login** remain the identity layer. The firewall adds agent identity on top of human identity; it does not replace it.

Build status

The firewall design is published ([Firewall PRD](#)). The database schema for credentials, revocations and the refusal log is written. Gates 1 to 3 exist as code but are not yet wired to a live system. Gate 4 is not built. Before anyone outside the team tests it, it needs real credential issuance (OAuth), a public revocation list and per-agent rate limits. That is estimated at about five days of work for a demonstrator. A government-grade version is a much larger programme and is costed in Section 8.

5. Open-source regulation

We propose that AI rules for government be published as code in public repositories, tested automatically, and amended through an open, attributed process. We call this *regulation as code*. The public can read the exact rule the firewall enforces, and anyone can propose a change.

How a rule changes

Agents may draft proposals; only a named human decides. That rule comes from the HRC's own [AI contribution policy](#): disclose, verify, hand off.

Why this can work in Israel

- **The precedent exists.** A 2014 cabinet resolution committed the government to publish its code. The ICT Authority publishes on GitHub as [CIOIL](#), and Israel made open-source code an Open Government Partnership commitment ([OGP IL0035](#)).
- **Deliberation at scale is proven.** Taiwan's vTaiwan used the pol.is platform to shape about a dozen laws, from fintech to ride-sharing ([Computational Democracy Project](#)). Its weakness was that the government did not have to respond. Our design fixes that: an accountable official must approve or reject every proposal that passes deliberation, and publish the reason.

- **Humanity-AI already runs this loop.** Our platform already runs pol.is-style votes, allowing one vote per person per statement, and keeps a hash-chained idea ledger.

Licensing and procurement

The HRC text is licensed CC BY-SA 4.0 and its code AGPL-3.0. Government lawyers will ask whether AGPL fits state procurement. We propose three options for the Digital Agency and the Accountant General to choose from:

1. **Keep AGPL.** The state runs the code itself; any changes it makes stay public, which is the point.
2. **Dual licence.** Core firewall code is also offered under a permissive licence (Apache-2.0) for integration by government vendors.
3. **State fork.** The state maintains its own open fork under its own licence and contributes improvements back.

Our recommendation is option 1 for the firewall and the rules, and option 2 for vendor-facing libraries. **[VERIFY with Accountant General's procurement rules]**

Security

Open code is not open access. Publishing the rules and the firewall code lets thousands of Israeli engineers find flaws before attackers do. Credentials, keys and citizen data are never public. The National Cyber Directorate should own threat modelling and a bug bounty from day one.

6. Start-up Nation 2.0: the Builders' Corps

The first Start-up Nation story was about building companies. The next one is about building the state itself, in the open, with credit going to the people who build it.

The story we inherit

In *Start-up Nation* (2009), Dan Senor and Saul Singer explained Israel's lead in startups ([overview](#), [CFR](#)). Their answer combined five ingredients:

- **Military units that train problem-solvers**, such as Unit 8200 and Talpiot
- **A flat, argumentative culture**, including *chutzpah*
- **Waves of immigration**, above all the Soviet aliyah of the 1990s
- **Tolerance of failure**
- **Yozma**, a 1993 government programme that seeded Israel's venture-capital industry by co-investing with private funds

The formula worked. Tech now drives Israel's exports and growth.

Where that story stalls

The formula produced companies, but not a better state. Critics describe a "dual economy": world-class tech sits beside public services and productivity that lag the OECD **[VERIFY: cite Bank of Israel / Taub Center]**. The companies are also moving abroad. Israeli tech firms now employ about 440,000 people outside Israel against about 400,000 inside ([Innovation Authority](#)). About 35% of companies report more requests from staff to relocate. The national AI programme aims to bring 100 scientists home; three had committed at last report ([JPost](#)).

The story we propose

Yozma seeded capital. The Builders' Corps seeds the state. In the 1990s the state co-invested in private funds and then stepped back. In 2027 the state opens its own operating system and invites its best engineers to build it with credit. Their names go on a public ledger for work that serves every citizen.

This gives an engineer a reason to stay, or to come home. The work matters to their family and neighbours. It is credited permanently under HRC clause I.1. And it can be done alongside a job, reserve duty or a startup.

How the Builders' Corps works

Element	Design
Who	Tech workers, reservists, 8200 and Talpiot alumni, students, returning emigrants and diaspora engineers. Deliberately recruited from Arab, Haredi and periphery communities.
What they build	The firewall, the citizen agent, the rule repository, and the translations and tests for all three
How they join	Verified identity, then vouched for by two existing members (governance). They then take the HRC oath.
Tours of duty	Flexible commitments of 3, 6 or 12 months, part-time or full-time, compatible with reserve service
Credit	Every contribution (code, review, translation, argument) is sealed to a named person on the ledger
Rewards	Innovation Authority Tnufa grants (up to NIS 200,000) for teams that spin out products; national supercomputer time; a public record usable in hiring
Quests	Specific problems posted as open challenges, for example "cut the time to register a business to one day"

Targets to test in V2

- 1,000 verified builders in year one; 10,000 in three years
- At least 20% of builders from under-represented communities
- 100 returning engineers who cite the Corps as a reason for coming home

A note on the book: this section refers to Start-up Nation and does not reproduce its text. We would welcome a conversation with the authors.

7. Funding and instruments

The first year costs an estimated NIS 150–250 million, and most of it can come from programmes that already exist. All figures are Humanity-AI order-of-magnitude estimates for V1, to be costed with the Finance Ministry's budget department in V2.

Workstream	Year-1 estimate (NIS m)	Existing instrument that can carry it
Citizen agent pilots in three services	50–80	Ministry IT budgets; the NIS 40m already set aside for 13 ministry AI projects (source)
Builders' Corps grants and quests	40–70	Innovation Authority: Tnufa , incubators, Magnet consortia, the high-tech stimulus package
Constitutional Firewall, government-grade, with security	30–50	National Digital Agency ICT budget; National Cyber Directorate
Programme office, legal work and independent evaluation	15–30	National AI Directorate (NIS 120m, mostly for 2026)
Inclusion and languages (Arabic, Russian, Amharic; accessibility)	10–15	Ministry for Social Equality; Digital Agency
Deliberation platform and public ledger	5–10	National AI Directorate
Compute	In kind	A reserved share of the national supercomputer (Telem) and future Directorate capacity
Total	150–255	

New money needed. We estimate that 60–70% can be redirected from existing lines, leaving roughly NIS 50–90 million of new money for the 2027 budget [**VERIFY with Finance Ministry**].

What the state gets back. Each pilot must publish its baseline before it starts: waiting times, staff hours per case, appeal rates and citizen satisfaction. Success is measured against those numbers, not against spend. If red tape costs the economy billions of shekels a year (Section 2), a few percent of saving repays the programme many times over.

Humanity-AI's contribution. The HRC, the firewall design, the deliberation software and the builder community are given to the state as a public good, under open licences. Humanity-AI.Quest does not ask to be paid for these. Contracts for building and running government systems go through normal public tenders.

8. Legal and legislative path

The roadmap moves in three legal steps: a government resolution in the first 30 days, budget items in the 2027 Arrangements Law, and a framework law once the HRC is ratified. Until the election, Humanity-AI follows strict election-law guardrails.

Step 1: government resolution (days 1-30)

A resolution needs no Knesset vote and can be passed at the new cabinet's first working meetings. It would do five things:

- Adopt the Constitutional AI Standard for civilian government AI
- Name one minister responsible, supported by the National AI Directorate
- Direct the Digital Agency and the Cyber Directorate to build the firewall in the open
- Choose three pilot services
- Direct the Innovation Authority to open the Builders' Corps call

The Attorney General's office should confirm that the standard is consistent with Basic Law: Human Dignity and Liberty, Privacy Amendment 13, and the Freedom of Information Law (1998).

Step 2: the 2027 budget and Arrangements Law

The 2027 budget and the Arrangements Law carry the money (Section 7) and any legal changes the pilots need. Examples are data-sharing permissions between ministries, and a legal basis for AI-assisted decisions that keep a human accountable. The relevant committees are Finance, Science and Technology, and Constitution, Law and Justice.

Step 3: a framework law (after ratification)

Once the HRC community has ratified v1, and after public deliberation, the Knesset can debate a short framework law, the *Public Service AI Law*. It would give the four firewall gates and the right to a human decision the force of law. The HRC's ratification threshold is still an open question for its founding members ([governance](#)). The state should not legislate a constitution that its own community has not yet ratified.

Election-law guardrails (now until 27 October)

This roadmap is requested by a party during an election campaign. That creates legal exposure that must be managed. We follow these rules:

1. **Equal offer.** The same document is offered to every party on the same terms and published openly. No party gets exclusive advice.

2. **No campaigning.** Humanity-AI does not poll voters, map voters, drive voters to polling stations or run ads urging a vote. Under the 2017 amendment to the Party Financing Law, those activities make a group an "organisation active in elections". That status brings donation caps and reporting to the State Comptroller ([Times of Israel](#), [Library of Congress](#)).
3. **No in-kind donation.** Israeli law tightly limits who may donate to a party and how much. Unpaid strategy work done *for* a party could count as an in-kind donation [**VERIFY: Party Financing Law, 1973, rules on corporate and in-kind donations**]. Publishing the roadmap for all parties avoids this.
4. **AI disclosure.** Any campaign material that uses this roadmap and contains AI-generated content must say so, under the July 2026 rules ([Haaretz](#)).
5. **Legal review.** An Israeli election lawyer reviews this document and the launch plan before either is made public.

Parts of this draft were written with AI assistance and reviewed by people, as the HRC's own policy requires.

9. Roadmap: 100 days, one year, three years

By the end of year three, every civilian government AI system sits behind the Constitutional Firewall, and a citizen can reach the ten most-used services through one agent.

Horizon	Milestones
100 days	Resolution passed; three pilots chosen and their baselines published; firewall specification out for public comment; Builders' Corps call open; first public deliberation held; firewall live in front of one pilot
Year 1 (2027)	All three pilots live behind the firewall with gates 1 to 4; citizen agent in Hebrew and Arabic for the pilot services; 1,000 verified builders; first rule amended through the open process; first independent evaluation published
Year 2 (2028)	Firewall mandatory for all new civilian government AI; citizen agent covers ten services in five languages; HRC v1 ratified by its community; framework law tabled
Year 3 (2029)	Every existing civilian government AI system behind the firewall; 10,000 builders; Israel offers the open stack to other democracies as a public good

Candidate pilot services

These are candidates for the Digital Agency to confirm. They are chosen for high volume, clear baselines and visible public pain.

Service	Why it is a good pilot	Main HRC duties tested
Population and Immigration Authority (passports, ID, registry)	Long waits and one of the most-used services	I.11 oversight, I.23 explanation
National Insurance Institute (benefit claims)	Decisions deeply affect people's lives; appeals are common	I.15 appeal, I.32 dignity, I.5 equity
Registering and licensing a small business	A direct measure of red tape for the economy	I.23 explanation, I.26 audit

How we measure success

- Time from request to decision, per pilot, against its published baseline
- Share of AI decisions appealed, and share of appeals upheld
- Firewall refusal rate. We expect it to stay **above** a minimum: a firewall that never refuses anything is not checking anything.
- Citizen satisfaction, broken down by language and community
- Number of verified builders and contributions merged, by community

10. Risks and honest limits

The biggest risk is overclaiming. This section says plainly what the roadmap cannot do.

Risk or limit	What it means	How we handle it
The firewall governs access, not thought	It controls what an agent may <i>do</i> to state systems. It does not control what a model thinks, or what an agent does elsewhere.	We never claim otherwise. Its scope is state systems and citizen data only.
Gate 4 is only as good as the clauses	A vague clause gives a vague verdict	Refusal rates are tracked with a minimum; unclear clauses are sent back for amendment
Sponsorship is accountability, not proof	A verified human can still sponsor a badly behaved agent	Revocation cascades to every agent the sponsor holds. The consequence falls on the sponsor, but harm can happen first.
The HRC is not yet ratified	Adopting a draft constitution invites the charge of adopting an unfinished text	The state adopts ten clauses as a standard, not as law. Law follows ratification (Section 8).
The system is not yet built	The firewall is designed but not wired; gate 4 does not exist yet	The 100-day plan starts with a public specification and one pilot, not a national rollout
"AI theatre"	Albania named an AI system as a "minister" in 2025 (TIME). Symbolic AI without accountability erodes trust.	Every AI decision has a named human owner. AI never holds office.
Political capture	A roadmap requested by one party may be seen as partisan	It is offered equally to all parties, published openly, and amendable by anyone (Section 8)
Security	Open code and a single gate make an attractive target	Cyber Directorate threat modelling, a bug bounty, staged rollout, and a human override (HRC clause I.22)
Exclusion	Arabic speakers, Haredi citizens, older people and the periphery may be left behind by an AI front door	Arabic from day one; the phone and in-person counter stay; equity data is published per pilot
Defence spill-over	HRC clause I.8 (Prohibition of Lethal Autonomy) touches national security	Defence is explicitly out of scope for this roadmap
Plan fatigue	This would be the fifth national AI plan in eight years	It does not compete with the National AI Program. It adds the trust layer that program lacks, and it reports against published numbers.

Appendix: verification list and sources

Still to verify before this goes to government

- ☐ Basic Law: The Government: coalition-formation deadlines (28 + 14 days)
- ☐ 2027 budget deadlines when a government forms after the fiscal year starts (Basic Law: The State Economy)
- ☐ Party Financing Law (1973): rules on corporate and in-kind donations to parties
- ☐ Hebrew text of the June 2026 National AI Program resolution and the May 2026 Responsible AI Guide
- ☐ Current cost of regulatory burden (replace the older \$4bn estimate)
- ☐ Bank of Israel / Taub Center source for the "dual economy" productivity gap
- ☐ Accountant General rules on open-source licences in procurement
- ☐ Year-1 cost envelope reviewed by a budget expert
