

The Agentic Nation

Israel's 1% government by 2029: a non-partisan roadmap for the next Knesset · V2 draft · 2026-09-24 · Humanity-AI.Quest

Status and purpose

This paper shows Israeli politicians what a government run through AI agents could look like by 2029. The state would run its routine work with about 1% of today's administrative staff and budget. Every citizen and visitor would get a personal agent that works for them.

- **Audience:** members and candidates of every party in the 26th Knesset, and the government that forms after 27 October 2026. The paper was requested by Orot Hashachar and is offered equally to all parties.
- **What changed from V1:** V2 focuses on what agents make possible, how government functions would operate, and the savings. The constitutional background has moved out of the main text.
- **Honest status:** the core technology (a firewall that checks every AI action, and a public decision ledger) is designed and partly coded by the Humanity-AI.Quest open-source community. It is not yet running in production. The 1% figure is a **design target to test in pilots**, not a proven result.
- **Sources:** facts link to sources. Items marked **[VERIFY]** must be checked against primary sources before publication. The scenarios in Section 1 are informed forecasts, not predictions.

The one-page answer

By 2029 Israel can run the paperwork side of the state (applications, permits, payments, case files and approvals) with about 1% of the people it uses today. The design target is roughly NIS 15–21 billion a year freed for citizens, and every Israeli holding a personal agent that deals with the state for them.

What changes for a citizen. You never fill in a government form again. Your personal agent already knows what the state knows about you, with your permission. It applies, pays, appeals and books on your behalf. A passport renewal, a business licence or a disability claim takes minutes, not months.

What changes inside government. Most routine decisions are made by AI "service agents" that follow published rules. Each passes a four-step check before it acts, and every decision is logged where the public can audit it. A small corps of human stewards writes the rules, handles hard cases and answers for the result. Teachers, doctors, nurses, police and soldiers stay human. They lose their paperwork, not their jobs.

What changes in democracy. Every policy is open to continuous citizen feedback and voting. The public result and the view of verified experts are published side by side. The Knesset stays sovereign, but it legislates with a live, verified reading of the public will.

What it saves (illustrative model, Section 4):

Item	Today	2029 target
Administrative civil servants in scope	~70,000–100,000 [VERIFY]	~700–1,000 stewards (1%)
Annual cost of that workforce	~NIS 17.5–25 bn	~NIS 0.2 bn, plus NIS 2–4 bn to run the AI
Net annual saving	—	~NIS 15–21 bn (about 2–2.5% of the 2026 budget of NIS 850.6 bn)
Time a citizen spends on bureaucracy	Hours per task, months per case	Minutes per task, handled by the agent

Why now. In September 2026 the United States framed AI, which it now calls "super intelligence", as a contest of national power (Section 1). Any country that does not run its own agentic state will rent one on another country's terms. Israel has the engineers, the compute programme and the urgency to go first, and to show other nations how.

What we ask the next government: in its first 100 days, pick three services to run agent-first. Publish their costs and waiting times today. Open the rules to public vote. Let the results decide the pace.

1. The world in 2026: America claims super intelligence

In one week of September 2026 the US President recast AI as an instrument of American power. He rejected any shared international oversight and signalled that the US will set the terms for everyone else. For Israel this is the context for every decision about AI.

What happened

Date	Event
22 Sep 2026	At the UN General Assembly, Trump renamed AI "super intelligence" (SI) for all US documents. He said the US "totally rejects any attempt to construct a globalist scheme of control" over it (CNBC , PBS)
19 Sep 2026	Trump announced an "AI Force", modelled on Space Force, and a new AI czar. He pledged not to "hinder or stifle" the industry (AI Jazeera , NBC)
14 Sep 2026	Trump called calls for AI guardrails a "SICK conspiracy" and AI risk a "hoax". This answered AI company leaders who had asked for more oversight (AI Jazeera , NBC)
Jun 2026	The Commerce Department abruptly barred foreign nationals from two frontier US models for about two and a half weeks. Access returned only after the developer made commitments, and Washington reserved the right to cut it again (CNBC , Euronews)
Jun 2026	An executive order on AI innovation and security put AI security under national-security agencies and ruled out licensing AI development (Presidency Project)
Jul 2025	An executive order created the "American AI Exports" programme: full US AI stacks packaged for allies, with fast-tracked licences for those who join (White House)
Jan-May 2025	Under the Biden-era AI Diffusion Rule, Israel was placed in the restricted second tier for AI chips, alongside the Gulf states and India. The rule was rescinded before it took effect (Times of Israel , BIS)

The lesson for Israel: access to the most capable AI is now granted, conditioned and withdrawn by Washington, sometimes within days. Even a close ally was once ranked second tier.

Five scenarios for a US-controlled SI era (2026-2030)

These are informed scenarios, not predictions. Each is built from the events above.

Scenario 1: The licensed ally. Israel joins the American AI Exports programme and runs its ministries on a packaged US stack. Services improve quickly. But the state's core systems run on models, chips and cloud whose licences Washington renews. *Justification:* the July 2025 export programme rewards exactly this choice. *Israel's position:* comfortable and dependent.

Scenario 2: The switch-off. A policy dispute, a security scare or a new US rule cuts foreign access to frontier SI for weeks, as happened in June 2026. Ministries built on that access stall, and Israeli engineers who are not US nationals are locked out. *Justification:* it has already happened once, and Washington reserved the right to repeat it. *Israel's position:* a government that stops working when another country flips a switch.

Scenario 3: Access for alignment. SI access becomes a lever in foreign policy, traded for positions on China, trade, Iran or the Palestinian arena. The terms change with each administration. *Justification:* the 2025 tier system already ranked countries by trust, and chip exports have already been used as bargaining chips. *Israel's position:* sovereign decisions shaped by a supplier.

Scenario 4: The race without brakes. The US rejects guardrails, calls AI risk a hoax and races China. A major AI-driven incident, such as an autonomous cyberattack, hits the global systems Israel depends on. Israel had no say in the rules and carries the damage. *Justification:* the September 2026 statements, and reported AI-driven cyber incidents in 2026 **[VERIFY: July 2026 Hugging Face incident]**. *Israel's position:* exposed to risks it did not choose.

Scenario 5: The indispensable partner (the path this paper recommends). Israel builds its own open, sovereign agentic state on top of whatever models it can access. It can swap models, run critical functions on national compute, and use the firewall to decide what any AI may do inside Israel. It trades on what the US needs from it: chip design, cyber defence, and a live national-scale demonstration of safe AI government. *Justification:* Israel's high-tech, cyber and compute programmes (Section 2). *Israel's position:* interdependent rather than dependent. It becomes a partner Washington cannot easily switch off.

The strategic point. In scenarios 1 to 4 Israel's government runs on terms set elsewhere. Only scenario 5 keeps the decisions in Israel. The agentic state described in this paper is how Israel reaches it.

2. Israel's choice: dependence, or a light to the nations

Israel can be the first country where every citizen, company and government function is AI-first by 2029, and where the people, not a foreign supplier, decide what AI may do. Isaiah called Israel to be "*a light to the nations*" (42:6, 49:6). In the age of super intelligence, that means showing the world a free society that governs AI rather than being governed by it.

Why Israel can do this first

- **Scale.** At about 10 million people, Israel is big enough to matter and small enough to change quickly. Estonia, with 1.3 million people, showed a small state can lead: its X-Road data exchange saves time worth about 2% of GDP a year ([e-Estonia](#)).
- **Talent.** Few countries have Israel's density of engineers, cyber experts and military technology units.
- **Compute.** A national supercomputer is already running, and the June 2026 National AI Program targets 100,000 processing units for national use ([Innovation Authority, PMO](#)).
- **Urgency.** October 7 showed what fragmented information costs in lives (Section 6). Tech workers are leaving: Israeli tech firms now employ more people abroad than at home ([Innovation Authority](#)). A national mission can bring them back.

The destiny, made concrete: Israel in 2029

Who	What they have by 2029
Every citizen	A personal agent they own. It handles the state, their money, their health admin and their emergencies, in their language.
Every visitor	A visitor agent from the moment of booking. It handles entry, transport, payments, safety alerts and help in their language.
Every business	Instant registration, licensing, tax and reporting, done agent to agent
Government	About 1% of today's administrative staff, acting as stewards of rules that the public can see and vote on
Democracy	Continuous, verified citizen voting on policy, with expert views shown alongside

The goal is not to replace people. It is to give each Israeli the capability that only the rich or well-connected have today: a tireless expert assistant, a lawyer, an accountant and a fixer, working for them alone.

A constitution for the agentic state, written by Israelis

Israel has never completed a written constitution. Since the 1950 Harari Decision it has built one chapter at a time, through Basic Laws. The agentic state needs a short, Israel-specific **Citizens' Charter for AI**, setting out the rules every AI agent acting in Israel must obey:

- Your data belongs to you, and your agent answers to you
- Every decision about you has a named, accountable human and can be appealed
- Every rule an agent follows is public, and the people can vote to change it
- No AI may deceive citizens or pose as a human

The Charter should be drafted in the open by the public and experts using the voting system in Section 7. It should then be adopted as a Basic Law. This is decentralisation in practice: the people write the rules the machines follow.

3. How the agentic state works

The agentic state has five parts: a personal agent for every person, service agents for every government function, public rules written as code, a firewall that checks every action, and a small corps of human stewards. Each part is simple on its own. Together they replace forms, queues and most of the back office.

Part	What it is	Who controls it
Personal agent	An AI assistant owned by each citizen or visitor. It holds their data in a personal vault and acts for them.	The citizen alone. They can switch providers or turn it off.
Service agents	AI workers for each government function, such as passport issuing, benefit assessment or business licensing. They apply the published rules.	The responsible ministry, through its human stewards
Rules as code	Every rule a service agent applies, published in plain language and in machine-readable form	Proposed by stewards, amended by public vote (Section 7), enacted by the Knesset or ministers
The firewall	A gate every agent must pass on every action. It checks four things: identity (registered agent), accountability (a named human is responsible), permission (the action is within its allowed scope) and rules (the action complies with published law and the Citizens' Charter).	Run jointly by the National Digital Agency and the National Cyber Directorate
Stewards	The roughly 1% of today's administrative staff who remain. They write rules, decide hard cases, handle appeals and answer publicly for results.	Civil service, accountable to ministers and the Knesset

One example: renewing a passport

The citizen speaks one sentence. Everything else happens agent to agent in minutes, and every step is logged. A human steward sees only the exceptions.

Design choices that protect sovereignty and trust

- **Model-agnostic.** Service agents can run on Israeli, open-source or foreign models, and can switch between them. No single supplier can switch Israel off (Scenario 5).
- **Critical functions on national compute.** Emergency, security and core registries run on Israeli infrastructure.
- **Everything is logged.** Every firewall decision goes to a tamper-evident public log that the State Comptroller, journalists and citizens can audit.
- **Open source.** The firewall and rules engine are built in the open by Israeli engineers, so thousands can inspect them for flaws.
- **Build status.** The firewall's design and data model exist as open-source work by the Humanity-AI.Quest community ([design](#)). The rules check is not built, and nothing runs in production yet. The first 100 days start with one pilot, not a national rollout.

4. The 1% government: function by function

The 1% target applies to the **administrative machinery** of the state: the people and budget that process, check, approve and file. It does not apply to money the state passes on to citizens (pensions, benefits, health, education, defence). It does not apply to front-line professionals either. In those areas agents remove the paperwork, and the savings go back into the service.

What each function looks like

Function	Today	Agent-first by 2029	Human stewards keep
Tax (income, VAT, property)	Returns, audits, assessments, call centres	Tax calculated continuously from data the citizen has consented to share; no annual return; anomalies flagged automatically	Tax policy, fraud cases, appeals
National Insurance (benefits)	Claims, medical committees, documents, months of waiting	The agent files automatically when a life event occurs (birth, job loss, injury); rule-based decisions in hours	Complex medical cases, appeals, the rules
Population and Immigration (ID, passports, visas)	Queues, appointments, repeated documents	Renewals and changes done agent to agent; visas decided in minutes for low-risk cases	Security vetting, exceptions
Business licensing and permits	Weeks to months, many authorities	One request; all authorities' agents check in parallel; a decision in a day	Rule-setting, inspections that need a person
Planning and building permits	Years in some cases	Plans checked automatically against published codes; neighbours notified by their agents	Planning committees on contested cases
Land registry (Tabu) and Land Authority	Paper-heavy transfers	Transfers and liens recorded instantly and verifiably	Disputes
Procurement	Long tenders, weak transparency	Tenders run and scored by agents against public criteria; every bid and score logged	Final award on large contracts
Courts administration	Scheduling, filing, forms	Filing, scheduling and document handling automated	Judges judge; this changes nothing about judicial decisions
Government back office (HR, payroll, finance, IT)	Duplicated in every ministry	One shared agent-run service	Oversight, audit

Function	Today	Agent-first by 2029	Human stewards keep
Citizen service centres	Phone queues, walk-in offices	The personal agent is the service centre	Human help desks for anyone who wants a person

Illustrative savings model

The estimate is simple: count the administrative workforce in scope, multiply by its cost, and subtract the cost of running the agents.

$$Net\ saving = (staff\ today - staff\ in\ 2029) \times cost\ per\ employee - cost\ of\ AI\ operations$$

Input	Assumption	Basis
Administrative staff in scope today	70,000–100,000	Central-government ministries and national authorities, excluding teachers, health staff, police and military [VERIFY with Civil Service Commission]
Staff in 2029 (1%)	700–1,000 stewards	Design target
Fully loaded cost per employee	~NIS 250,000 a year	Average state-employee salary of about NIS 17,400 a month, plus employer costs (Jerusalem Post) [VERIFY: update to 2026]
AI operations (compute, security, stewards' tools)	NIS 2–4 bn a year	Humanity-AI estimate
Net annual saving	~NIS 15–21 bn	About 2–2.5% of the NIS 850.6 bn 2026 budget (Times of Israel)

The model does not count several larger gains that are harder to measure:

- **Citizens' time:** hours of queues and forms returned to work and family
- **Business speed:** companies licensed in days instead of months
- **Fewer errors and less fraud:** consistent rules, fully logged
- **Front-line capacity:** teachers, doctors and police freed from paperwork

Estonia's far simpler digital system already returns about 2% of GDP a year ([e-Estonia](#)). An agentic system should exceed that.

How the 1% is reached without mass layoffs: see Section 8. The transition uses attrition, redeployment and retraining over three years.

5. The agentic nation: life for citizens and visitors

When every person has an agent, Israel can become the easiest country in the world to live in, do business in and visit. The state stops being something people queue for. It becomes a service that comes to them. Agents also raise earning power for everyone, not just the tech sector.

Everyday use cases

Who	Today	With a personal agent
New parents	Register the birth, then apply separately for ID, child allowance, a health fund, parental leave and daycare subsidy	The birth is recorded at the hospital. Every registration, allowance and leave request is filed automatically, and the parents confirm with one tap.
Someone starting a business	Weeks of registrations with the Tax Authority, National Insurance, the municipality and licensing	One conversation. The business is registered, licensed and tax-ready in a day. The agent keeps the books, files VAT and finds matching Innovation Authority grants.
New immigrants	Months of absorption bureaucracy in a new language	From the moment their aliyah is approved, an agent in their own language sets up ID, the absorption basket, a health fund, a bank account, Hebrew classes and driving-licence conversion
Reservists and their families	Separate claims for compensation, employer protection, family support and business relief	Call-up automatically triggers every entitlement. The agent notifies the employer, claims compensation and keeps the family business running.
Older people	Many people never claim their full entitlements because the system is too complex	The agent claims every right the person qualifies for, explains letters, books medical appointments and alerts family if something is wrong
Job seekers	Unemployment claims, job boards and training programmes in separate systems	The agent claims benefits, matches jobs and retraining, and applies for the person
Visitors	Entry forms, SIM cards, transport cards, VAT-refund queues, a language barrier	A visitor agent from the moment of booking. It handles electronic entry, transport, payments and an automatic VAT refund, and gives safety alerts and medical help in the visitor's language.

Agents as an earning multiplier for every citizen

Today only large firms can afford lawyers, accountants, marketers and analysts. A personal agent puts that capability in everyone's hands:

- **A plumber or hairdresser** runs bookings, invoicing, marketing and tax like a firm with a back office
- **A farmer in the periphery** sells direct to buyers in Israel and abroad, with contracts and logistics handled by agents
- **A freelancer** finds work, negotiates rates and gets paid through agent-to-agent contracts
- **A student** has a tutor in every subject, in their language, around the clock

This is how agents raise GDP *per person*, not just in the tech sector. It works by removing the admin that caps what individuals and small businesses can earn. **[V3: model the productivity gain with the Bank of Israel.]**

Israel as the most welcoming country to visit

Israel welcomed about 1.3 million tourists in 2025, as tourism began to recover ([Jerusalem Post](#)). A visitor who never queues, never struggles with a form or a language, and gets real-time safety information will tell friends. That is the fastest route back to pre-war tourism.

6. Resilience and security: a connected nation that protects itself

When every citizen's agent is connected in real time, the nation can sense, coordinate and respond faster than any central command. The principle is to **put the tools in citizens' hands**, so that safety never depends on one ministry getting its information in time.

Flagship case 1: mass-casualty events

What went wrong on October 7. The State Comptroller found "a complete lack of coordination" between the army and Magen David Adom in evacuating the wounded. Transfer points between military and civilian ambulances were coordinated only after a delay of **nearly eight hours** ([Times of Israel](#)). The government also had no body coordinating the civilian response. Volunteer and donation efforts worth about **NIS 14.8 billion** in the first three months went largely uncoordinated ([Jerusalem Post](#)).

How an agentic nation responds. Technology cannot prevent an attack like October 7. What this system targets is the hours of confusion that followed.

1. **Detect in seconds.** Opt-in acoustic sensors on community infrastructure and citizens' own devices recognise gunfire and explosions. They send only event type and location, never voices. Public-space cameras switch into incident mode only when an emergency is declared.
2. **Build a live picture.** Every alert, sensor event and citizen report ("shots near the north gate", "three wounded in house 12") is combined into one live incident map. The army, police, Magen David Adom, the community security team and residents all see it at once.
3. **Guide every person.** Each resident's agent gives personal instructions: stay in the safe room, move now by this route, a medic is two houses away. It confirms who is safe, so families and rescuers know who is missing.
4. **Coordinate rescue.** Agents match the wounded to the nearest ambulance, medic or evacuation point. They hand over automatically between military and civilian services, with no phone chains.
5. **Mobilise civilians.** Volunteers, drivers, doctors and donors offer help through their agents and are matched to verified needs in real time.

Flagship case 2: stopping an epidemic in its tracks

The lesson from COVID. Israel's HaMagen app was widely distrusted. It gave false alerts, drained batteries and raised privacy fears. An Israel Democracy Institute report said 98% of users of the second version eventually deleted it ([CIO](#)). Modelling published

in *Science* found that fast digital contact tracing can push an epidemic's reproduction number below 1 if enough people take part (Ferretti et al., 2020).

How an agentic nation responds. The contact record lives on each citizen's own agent, not in a government database. When someone tests positive, their agent anonymously notifies the agents of recent close contacts. Each contact gets a **24-hour quarantine request**, with testing booked, sick-leave filed with the employer, and food delivery offered. The request is voluntary, private and friction-free, so people comply and the chain of infection breaks. The design goal is to keep the reproduction number below 1 without lockdowns **[VERIFY: modelling for Israel]**.

Ten more use cases

Situation	What citizens' agents do
Everyday money	Payments, savings, credit and tax happen agent to agent, instantly and at near-zero cost. Branches, queues and fees largely disappear, and banks become back-end providers. Linked to Bank of Israel's digital shekel work [VERIFY status] .
Rocket and missile alerts	Personal shelter guidance by location; automatic "I'm safe" check-ins to family; property-damage claims filed with photos in minutes
Evacuated communities	Housing, school places, grants and job support arranged automatically for displaced families
Volunteers and donations	Every offer of help matched to a verified need, with no duplication or gaps, which was the October 7 lesson
Blood and medical supplies	Hospital shortages go directly to eligible donors' agents, who book a slot nearby
Cyber attacks	A compromised agent is revoked everywhere in seconds; citizens' agents switch to backup channels
Earthquakes (Israel sits on an active fault line)	Seconds of early warning, personal evacuation routes, and automatic reports of who is trapped and where
Heatwaves	Agents check on older and vulnerable people living alone and alert family or services
Scams and deepfakes	Agents verify every caller and message claiming to be a bank, ministry or relative, and block impersonation
Wildfires and floods	Evacuation routes updated in real time, with shelters and transport booked for those without cars

Safeguards built in

- **Citizen-owned.** Sensors and data belong to the community or the individual, and joining is opt-in.

- **Minimal data.** Event types and locations only; no voice recording; cameras switch on only in a declared emergency.
- **Time-limited.** Emergency powers switch off automatically, and every activation is logged for the State Comptroller.
- **Works offline.** Agents keep working on the phone during network outages.

7. The people decide: continuous voting, with experts heard

Every rule the agentic state follows is open to citizen feedback and a vote at any time. Results are published in two columns: what the public thinks, one person one vote, and what verified experts in that field think. Ministers must act on the result or explain in public why not. This is how decision-making moves from offices to the people without losing expertise.

How a policy decision works

1. **Anyone can propose.** A citizen, a steward or a Knesset member proposes a change, for example "allow small shops to open on Friday afternoons with a single permit".
2. **Every citizen gets a neutral briefing.** Their agent explains the proposal in plain language, shows how it would affect them, and gives the strongest case for and against. The agent may not push a view.
3. **People vote on short statements.** Participants agree, disagree or pass on short statements, as in Taiwan's vTaiwan process, which helped shape about a dozen laws ([Computational Democracy Project](#)). The system surfaces statements that win agreement across opposing groups, not just majorities.

4. **Two tallies are published side by side.** The **public tally** counts one verified person, one vote. The **expert tally** counts the votes of people with proven expertise in the field, weighted by that expertise.
5. **Decision-makers must respond.** If a proposal passes agreed thresholds, the responsible minister or Knesset committee must adopt it or publish a reasoned rejection within a fixed time.

How expertise is weighted

Mechanism	How it works	Why
Verified expertise	Professional credentials, peer endorsements and a track record in the field, such as doctors on health rules or engineers on building codes	Gives informed judgement more weight in its own field
Topic delegation	A citizen can hand their vote on a topic to someone they trust (a doctor friend, an NGO, their MK) and take it back at any time. This is known as liquid democracy (overview).	People who lack time still take part through someone they choose
Two columns, never blended	The public and expert results are always shown separately	No one can hide the public will behind the experts, or ignore the experts
When they disagree	Where public and experts diverge sharply, a deliberation round is triggered before any decision	Disagreement becomes a conversation, not a veto

Safeguards

- **One person, one vote.** Verified identity; anonymous ballots; protection against bots and fake accounts.
- **No manipulation.** Agents must brief neutrally. They cannot vote on a citizen's behalf without that person's explicit instruction on that vote.
- **Minority protection.** Votes cannot override Basic Laws or individual rights; the courts stay the backstop.
- **The Knesset stays sovereign.** Israel's only binding referendum law covers giving up territory. Citizen votes therefore start as a duty to respond. They become binding only in areas the Knesset delegates by law, for example through a proposed *Public Voice Law*.

Already working in miniature. The Humanity-AI.Quest platform already runs agree / disagree / pass votes, with one vote per person per statement, and a tamper-evident ledger of proposals (humanity-ai.quest).

8. Roadmap to 2029 and the workforce transition

The path to a 1% administration runs in four stages over three years. Each stage is gated by published results. Staff move to better jobs through attrition, redeployment and retraining, not mass dismissal.

Stages

Stage	When	What happens	Gate to the next stage
Prove	First 100 days	Government resolution. Three pilots chosen (candidates: passports, National Insurance claims, business licensing), with baselines published. Firewall live in front of one pilot. First public vote on a pilot rule.	Pilot beats its baseline on time, cost and satisfaction
Scale	2027	All three pilots agent-first. Personal agents offered to every citizen in Hebrew and Arabic. Visitor agent launched at Ben Gurion. Emergency coordination piloted in two regional councils.	Uptake above 50% in pilot services; error and appeal rates at or below today's
Transform	2028	Ten most-used services agent-first. Shared back office for all ministries. Citizens' Charter drafted by public vote.	Independent evaluation by the State Comptroller
Lead	2029	Administrative staff at about 1%. Charter adopted as a Basic Law. Israel offers the open system to other democracies.	—

The workforce transition: nobody is thrown away

Politicians will rightly ask what happens to tens of thousands of civil servants. The answer has five parts:

1. **Attrition first.** Stop replacing administrative roles as people retire or leave. Normal turnover covers a large share of the reduction over three years **[VERIFY: annual civil-service turnover rate]**.
2. **Redeploy to the front line.** Israel lacks teachers, nurses, care workers and social workers. Former administrators with the right skills move into these roles with full retraining and pay protection.
3. **Become stewards and auditors.** The best case-handlers become the 1%: rule-writers, appeal officers and AI auditors.
4. **Join the builders.** Technically minded staff join the open-source teams that build and maintain the system.

5. **Generous voluntary exit.** Early-retirement and transition packages are funded from the first year's savings.

This needs an agreement with the civil-service unions, above all the Histadrut. We propose opening that negotiation in the first 100 days, with a guarantee of no forced redundancies during the pilots.

Election-law note

This paper is offered equally to every party and published openly. Humanity-AI.Quest does not campaign, poll or mobilise voters. An Israeli election lawyer will review the paper before any public launch.

9. Safeguards, risks and honest limits

An agentic state concentrates great power in software. The design has to assume things will go wrong, and it has to make failures visible, reversible and accountable.

Risk	What could happen	Safeguard
Surveillance creep	Emergency sensors and data become permanent state monitoring	Citizen-owned data; opt-in sensors; emergency modes that switch off automatically; every activation logged and audited
Wrong decisions at scale	A faulty rule denies thousands of people a benefit	Staged rollout; every decision appealable to a human; error rates published; automatic rollback when appeals spike
Cyber attack	A hostile state takes over agents or data	Firewall with instant revocation; critical systems on national compute; open code reviewed by thousands; National Cyber Directorate ownership
Foreign dependence	A supplier cuts off models, as in June 2026	Model-agnostic design; Israeli and open-source fallbacks; national compute for critical functions
Digital exclusion	Older people, Haredi and Arab citizens, and the periphery are left behind	Arabic, Russian, Amharic and English from day one; voice-first agents; human help desks remain; outcome data published by community
Manipulation of votes	Bots, pressure campaigns or biased agent briefings sway results	Verified identity; anonymous ballots; neutral-briefing rules, with audits of agent briefings
Tyranny of the majority	Votes target minorities	Votes cannot override Basic Laws or individual rights; the courts remain the backstop
Labour conflict	Unions block the transition	No forced redundancies in the pilots; redeployment and retraining; negotiation from day one
Overpromising	The 1% target is missed, and trust collapses	Each stage is gated on published results; targets are presented as targets

What this paper does not claim

- The 1% figure and the NIS 15–21 billion saving are **design targets from an illustrative model**, not proven results. The pilots exist to test them.
- The core firewall is **designed but not yet running**; its rules check is not built.
- Technology would not have prevented October 7. It can shorten the chaos after an attack.
- The scenarios in Section 1 are informed forecasts, not predictions.

Appendix: verification list and sources

Still to verify before publication

- ☐ Administrative civil-service headcount in scope (Civil Service Commission) and the 2026 fully loaded cost per employee
- ☐ Annual civil-service turnover rate (to size the attrition path)
- ☐ Details of the September 2026 US announcements from primary sources (White House, Federal Register)
- ☐ The reported July 2026 AI-driven cyber incident (Scenario 4)
- ☐ Status of Bank of Israel's digital shekel
- ☐ Epidemic modelling for Israel (24-hour quarantine requests)
- ☐ Legal basis for a Public Voice Law and for delegating binding citizen votes
- ☐ Savings model reviewed by a budget expert and the Bank of Israel
